1 Introduction and Findings

Telecommunications Class 750 for Spring 2021 performed a follow-on analysis of rural broadband communication on the Virginia Eastern Shore as part of their course work. The follow-on analysis was of the Fall 2020 TCOM 750 class work. The TCOM Graduate Students reviewed current legislative initiatives and incentives, existing providers, emerging solutions and coverage options. The Spring 2021 TCOM Graduate Students were:

- Akram M. Arabi
- Michael Fornah
- Adam Tristan
- Thanh V. Vo

The efforts of the Fall 2020 Graduate students were appreciated and they are acknowledged below.

- Khalid Al-Hassan
- Jennie Tran
- Seid Mohammed
- Bharani Reddy Mallugari
- Kapil Bains

For ease of analysis the Eastern Shore of Virginia was chosen due to its favorable geography for wireless communications and due to the familiarity with several of the participants. Identified provider options, current and future, included:

- Satellite Broadband
    - Hughes
    - Dish Network
    - STARLINK (Space X)
    - O3b mPower by SES
    - OneWeb
- Fiber to the Home (FTTH)
    - Eastern Shore Virginia Broadband Authority (ESVBA)
    - Eastern Shore Communications Corporation (ESCC)
- Last Mile Wireless
    - Neubeam
    - Eastern Shore Communications Corporation (ESCC)
- Cellular Internet/Fixed Wireless
    - T-Mobile/Sprint
    - Verizon
    - AT&T
- Cable Television Providers[1][2]

[1] Article "Cable's evolutionary path leads to mobile, convergence" detailing cable companies new business approach, website https://www.lightreading.com/cablevideo/cables-evolutionary-path-leads-to-mobile-convergence/d/d-id/764609?, accessed 10 December 2020.

[2] Article "How rising broadband demands might reshape US telecom", website https://www.lightreading.com/opticalip/how-rising-broadband-demands-might-reshape-us-telecom/d/d-id/764382?, accessed 10 December 2020 describes how customers are flocking to fixed broadband providers like Comcast and Charter in unprecedented numbers.

- Charter/Spectrum[3]

Key findings were as follows:

- The cost of providing service to rural isolated citizens features a low return on investment and alternative approaches to providing services in outlying areas need to be explored.
- Government efforts to stimulate broadband coverage to all residents are generally ineffective.
- Accomac and Northampton Counties chartered the Eastern Shore of Virginia Broadband Authority (ESVBA) as a non-profit, but it is not aggressive in pursuing options/partnerships to extend coverage. An example of excellent partnerships are the Dominion-All Points Partnership and the NOVEC-All Points partnership discussed in this report. The fact that ESVBA has re-paid its loans to the counties is not a comforting thought to citizens who do not have service.
- Last Mile wireless providers, Eastern Shore Communications (ESCC) and Neubeam are wary of competition/cooperation with ESVBA and have stated they feel ESVBA will help them develop new markets but then encroach on those areas negating their investments.[4][5]
- Citizen frustration with the slow pace of coverage is readily apparent and is not mitigated by piecemeal efforts such as provisioning WiFi hotspots throughout the counties.[6][7]
- The shutdown due to COVID-19 has placed a great burden on public school students who often do not have the means to perform adequate coursework remotely.
- County led efforts to provide broadband to isolated communities are limited in scope.[8]
- Alternatives, such as Starlink satellite broadband SpaceX which promises exceptional speed and low latency to a limited number of households, are emerging, but not at a scale to make a difference to most citizens and their cost is approximately double other broadband options could be if they were more broadly available.

[4] Errata (https://www.easternshorepost.com/2019/01/24/internet-provider-says-broadband-authority-poses-unfair-competition/)

- ESVBA "directly competing with us" and causing an "imbalance" in local market, Eastern Shore Communications CEO Ronald Van Geijn said.
- ESVBA acted as a last-mile provider, supplying high-speed internet directly to government organizations and businesses starting in 2010 and homes beginning in 2016.
- "ESVBA is not a middle-mile provider," ESVBA Executive Director Robert Bridgham recently emphasized. A middle-mile provider typically offers wholesale pricing to companies that provide end-users with high-speed internet at retail prices.

- Cable providers are beginning to provide home broadband, but in areas that may not be most beneficial to rural users[9] and most likely in competition with other feasible providers. [10]
- Virginia has the 5th highest cost for broadband service in the United States[11] and for many on the Eastern Shore it is essentially unobtainable with no substantial changes in sight.
    - ESVBA's most inexpensive plan for residential customers is $39.99/month for 10/5 Mbps Download/Upload[12]
    - Local Wireless Providers are charged a discounted and must subsequently add to that rate to make the service economically viable.
    - Starlink Unlimited service is $99.00/month, but is limited in capacity to approximately 1.5 million customers across the United States.
    - Cellular Service Mobile Hotspot service such as T-Mobile's, where available, can be as low as $10.00/month under their military plan for 2GBits/month of data with additional data for purchase.
- Commercial telecom providers such as T-Mobile, Verizon and AT&T are beginning to offer innovative home broadband services, but it is expected to be several years before these are widely deployed, especially on the Eastern Shore. [13][14]
- The rural areas of Virginia's Eastern Shore suffer from the tyranny of distance where it is too expensive to economically extend service to them without some type of subsidy. This is shown in **Figure 1 Cellular Capacity vs Latency vs Coverage Area**.

[9] Article "Gov. Northam Returns Home for Event on Broadband Expansion for the Shore", website https://www.easternshorepost.com/2020/11/12/gov-northam-returns-home-for-event-on-eastern-shore-broadband-expansion/, accessed 11 January 2021.

[10] Article "T-Mobile in Home Internet", website https://www.theverge.com/2018/9/21/17886574/t-mobile-in-home-internet-sprint-5g-goals-charter-comcast, T-Mobile is planning to offer in-home internet based on 5G service, to be the 4th largest ISP in America by 2024. Its goal is to cover "52% of the zip codes across the county by 2024," "64% of Charter's territory and 68% of Comcast's territory."

3 Analytic Approach

Our analytic process followed a 5-step approach and is shown in Figure 2 The George Mason Approach Followed a 5-Step Process to Acquire the Data, Select Candidate Areas and Determine Coverage Types and Effect.

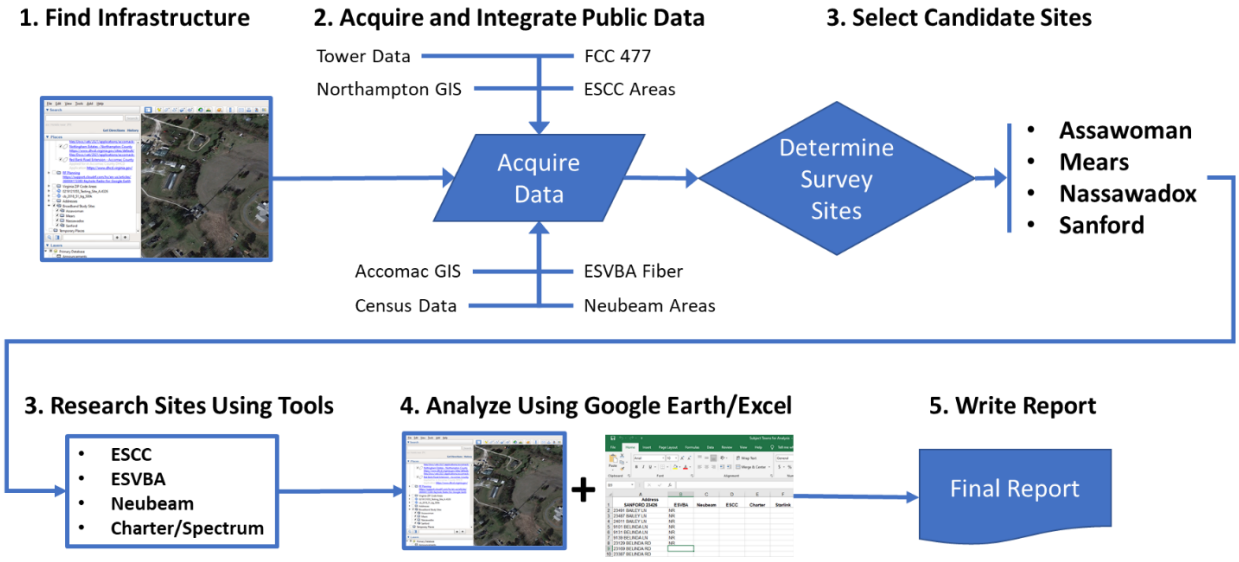

Figure 2 The George Mason Approach Followed a 5-Step Process to Acquire the Data, Select Candidate Areas and Determine Coverage Types and Effect

Our analytic approach began by reviewing visible infrastructure on the Eastern Shore and determining census areas[15][16][17] and United States Postal Service ZIP Code areas. We identified the towns and areas in the two counties and acquired all of the known addresses in the two counties. We also identified via visual observation in Google Earth and using corresponding data from Cell Mapper[18] and Cell Reception[19] we were able to accurately locate cell towers in the two counties.

In the Fall 2020 study by the TCOM 750 students we did acquire partial GIS files of the ESVBA based on information they provided via several Requests for Proposals (RFP) where they provided GIS data for existing and planned extensions to their service area. Mr. Robert Bridgham was kind enough to attend a Zoom class and provide a lot of background on the ESVBA and their network. He was reticent to provide

[19] Website Cell Reception, website http://www.cellreception.com/towers/towers.php?city=accomac&state_abr=va, accessed 21 April 2021.

more detailed information on the exact routing of the fiber infrastructure, but in some quick field surveys we were able to determine how the fiber is laid with approximate routes. In these field surveys and also using their websites we also were able to determine the locations of most of the Radio Frequency to Home (RFTH) towers utilized by Neubeam and ESCC and approximate coverage areas.

For Accomac County we were able to go to their Accomac County Open Data Portal (https://accomack-county-virginia-open-data-portal-accomack.hub.arcgis.com/datasets/accomack-county-addresses?showData=true) to download all of the county addresses and pick out the addresses using Microsoft Excel to sort them by ZIP Code, town and street. We identified 27,191 unique addresses in Accomac County.

For Northampton County we were able to request the addresses via their Geographic Information Service (GIS) office (https://www.co.northampton.va.us/government/departments_elected_offices/planning_permiting_enforcement/planning/gis_program) and they supplied the GIS files where we again used Microsoft Excel to sort them by ZIP Code, town and street. We identified 9,267 unique addresses in Northampton County.

We did identify discrepancies when we reviewed the Accomack/Northampton Regional Broadband Ext. Project (VATI) 2021 Grant Request (https://www.dhcd.virginia.gov/sites/default/files/Docx/vati/2021/applications/accomack-county-application-VATI2021.pdf) as of the eight sites identified four of them we were not able to find them in our address lists or via Google Earth. But in reviewing the application we found that most were either new developments or we identified with different parameters than what the GIS offices use. By identifying adjacent streets on the overhead views on pages 14-21 of the report we were able to find the proposed developments.

We were also able to acquire all of the Federal Communications Commission (FCC) Form 477 applications at the FCC Open Data site (https://opendata.fcc.gov/Wireline/Fixed-Broadband-Deployment-Data-December-2019/whue-6pnt/data) but given the limited information on the summaries they only enabled us to identify the providers in the two counties who were registered and a relative value of their business scope. We did find

After reviewing the infrastructure and defined areas we selected Assawoman, Mears, Nassawadox and Sanford for the following reasons:

- Assawoman – Area was generally close to Rt 13 and the ESVBA fiber, area was lightly populated, area was poorly served and disadvantaged enough due to power pole routing to be a challenge.
- Mears – Centrally located close to Rt 13, but not near enough to gain direct fiber; lightly populated.
- Nassawadox – Adjacent to Rt 13 and we believed it should be well served, but wanted to confirm.
- Sanford – Located directly around the ESVBA fiber run; felt the area should be well served with Fiber to the Home (FTTH); a test case similar to Nassawadox with criteria.

Given the street addresses we accessed the ESVBA, Neubeam, ESCC and Spectrum websites to see what availability the vendors exhibited. Their websites are shown in the following four figures.

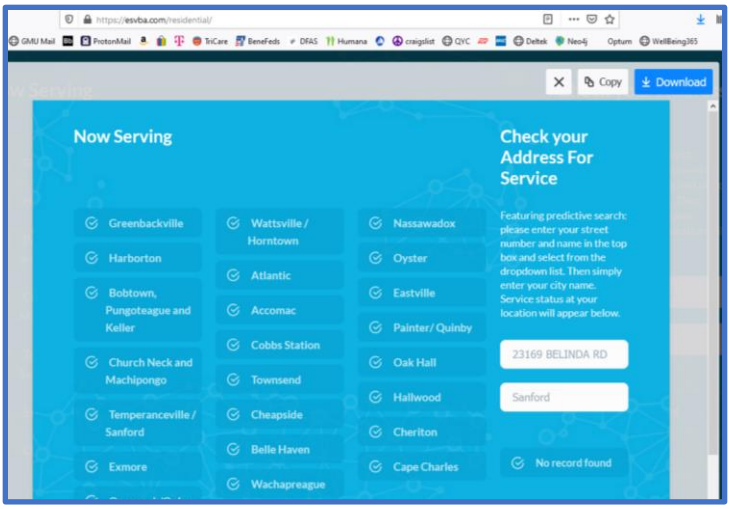

Figure 3 ESVBA Address Search Feature

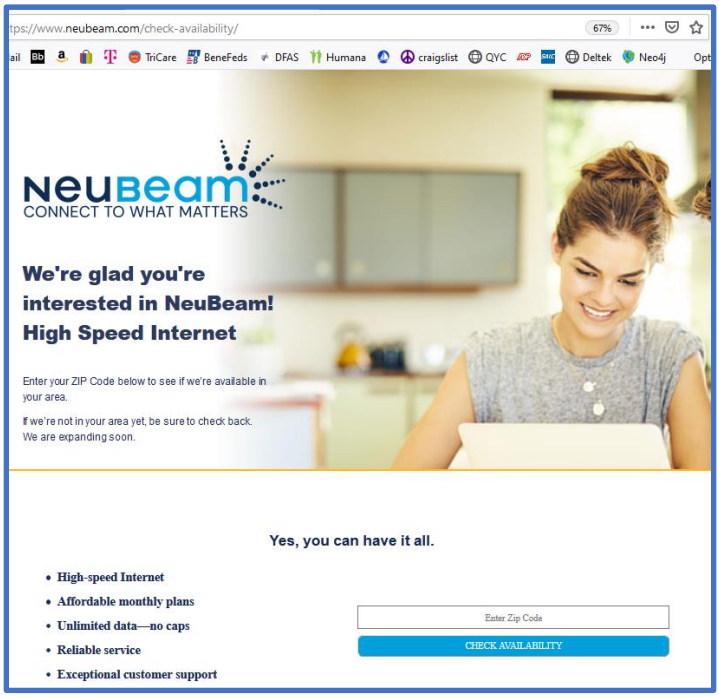

Figure 4 Neubeam Address Search Feature

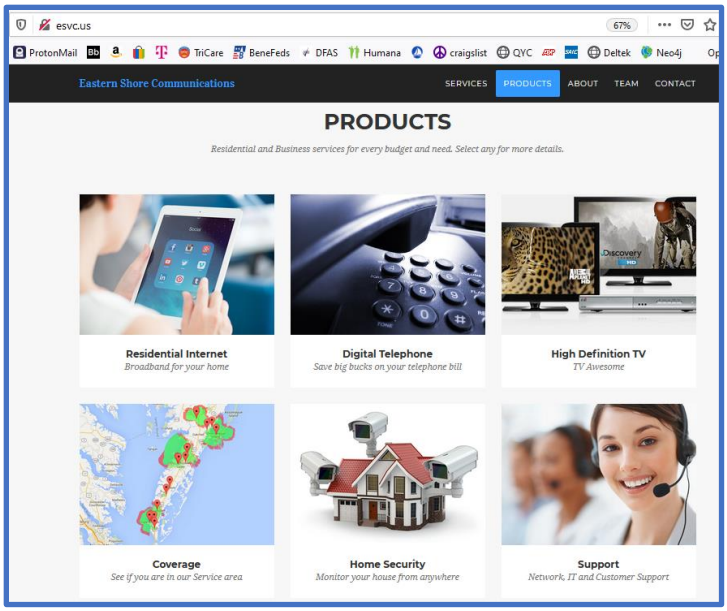

Figure 5 Eastern Shore Communications Site (Note the residential search feature was down when screenshot was taken)

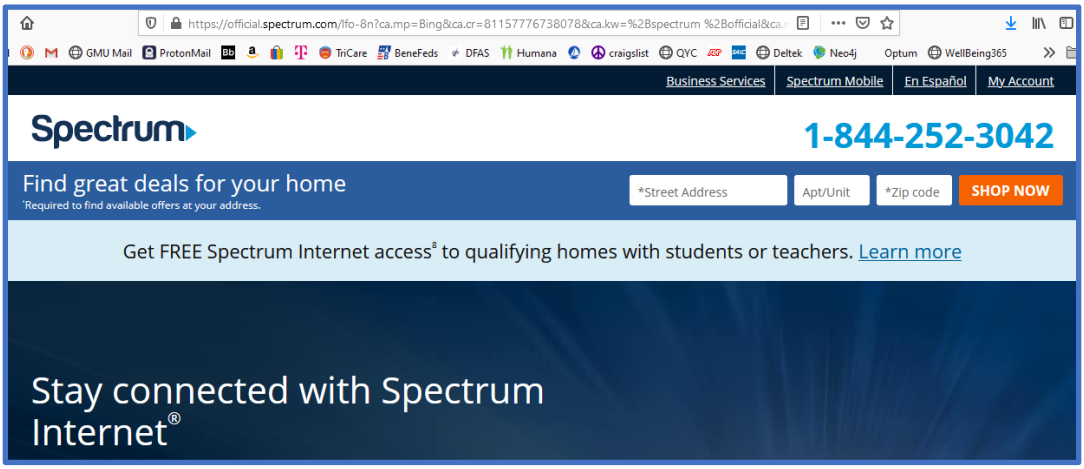

Figure 6 Charter/Spectrum Internet Coverage Search Page.

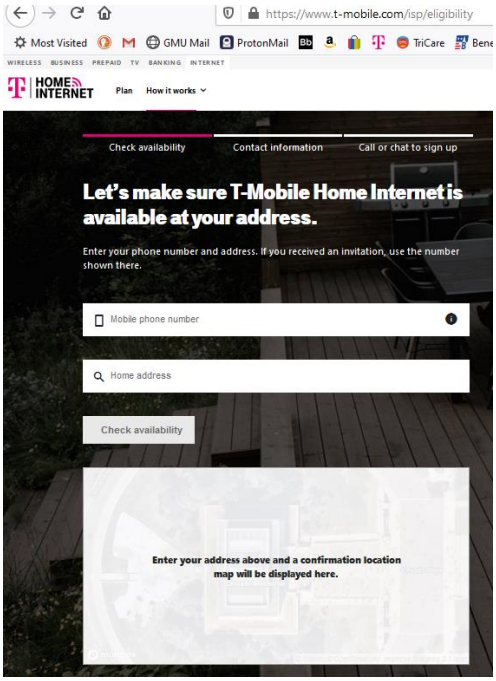

Figure 7 T-Mobile Internet Coverage Search Page.

4 Point-to-Point Wireless Technology

The last-mile has traditionally been referred to as the hardest part of deploying any service to remote customers. With the cost of physically laying infrastructure as well as the cumbersome process and the disruption to constituencies and infrastructure it is usually a daunting task. Virginia's Eastern Shore is fortunate to have at least two wireless providers in ESCC and Neubeam who have last-mile distribution technologies and a process for determining how to efficiently extend their business footprints. We were also impressed by the ESVBA approach in providing towns with "boilerplate" Request for Proposal (RFP documents to help the towns plan for and acquire Internet services for their towns.

In our limited onsite surveys, we noted that Neubeam has employed some point-to-point links and would like to see more of this. It appears the antenna is a mANT30 PA Parabolic dish antenna[20] for 5GHz with 30dBi gain. This model includes precision alignment mount and is designed to be mounted on a pole as illustrated. We understand this is how Neubeam increases the range of their coverage. Neubeam has also advertised their coverage via point-to-point link to Smith Beach, Vaucluse Shore and Wilsonia Neck.

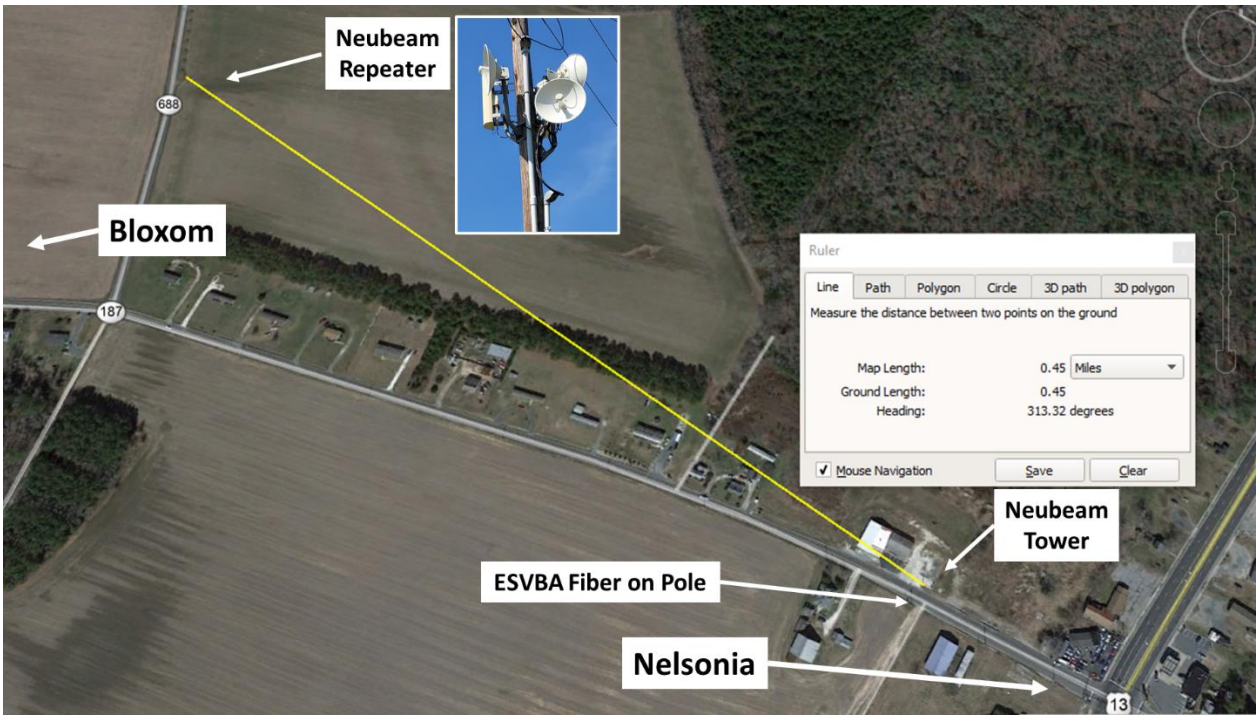

Figure 8 Neubeam has employed 5GHz Repeaters

[20] mANT30 PA Product Information, website https://mikrotik.com/product/MTAD-5G-30D3-PA, accessed 21 April 2021.

5 Recommendations

The TCOM 750 graduate students recommended the following actions to enhance Virginia's Eastern Shore Broadband options.

- Leverage existing ESVBA fiber and treat ESVBA as the default
- Extend ESVBA Fiber Plant with using ANEC Power Lines
- Leverage Facebook's Fiber deployment by a robot or similar solution
    - NetEquity Networks was spun off from Facebook with its technology to be available 2021
    - Cost as low as $2/meter
- Expand and formalize partnerships with wireless broadband service providers Neubeam and ESCC
- Provide bulk reseller discounts to wireless broadband service provider to enhance service providers business case
- Ensure Neubeam and ESCC investments are protected by a franchise agreement
- Mandate companies work in a collaborative manner to qualify for incentives
- Leverage Eastern Shore Chamber of Commerce as a Key Partner/Arbiter

Table 1 Options for Connecting Homes to the Internet using Distance as a Discriminator

Category	Backbone Provider	Middle-Mile Providers	Last-Mile Provider
Homes < 500 meters from fiber backbone	ESVBA	ESVBA	ESVBA
Homes (5+) < 1 mile from fiber backbone	ESVBA	ANEC/NetEquity	ESVBA
Homes (< 5) < 5 miles from fiber backbone	ESVBA	ANEC/NetEquity	Neubeam or ESCC
Neighborhood (5+) < 5 miles from fiber backbone	ESVBA	ANEC/NetEquity	ESVBA
Neighborhood (5+) 5+ miles from fiber backbone	ESVBA	ANEC/NetEquity	Neubeam or ESCC
Remote Homes 5+ miles from fiber backbone; no near neighbors	Starlink	N/A	Starlink[21]

[21] Potentially eligible for support from FCC Rural Broadband fund.

6 Appendix A - Accomac and Northampton County Coverage Options by Zip Code

In **Table 2 Accomac and Northampton Counties Zip Codes and Providers**, a list was assembled of various options. No effort was made to validate the quality of the offered services; all representations were accepted with the caveat they may not be 100% accurate. The survey results are organized by Zip Code/Town/County and then by ESVBA Coverage, local wireless providers ESCC and Neubeam, Cable/Satellite/Wired providers, and proximity to fixed infrastructure.

Table 2 Accomac and Northampton Counties Zip Codes and Providers[22][23]

7 Appendix B - Smith Beach Survey

A drive through survey was conducted on Smith Beach in Northampton County. There we observed a Neubeam transmission tower and numerous local residential receive antenna throughout the community. An overhead view of the community as shown in Error! Reference source not found.. The primary RF to Home pole shown in **Figure 10 Neubeam Microwave Antenna, Local Antennas and Service Box Serving Smith Beach** majority of the community is on Rt 666 and Toms Lane and every home appeared to have a receiver dish similar to the one shown in **Figure 11 Typical RF to Home (RFTH) Residential Installation – a 6' Pole with a Directional or Flat Panel Antenna**.

The Flat Panel antenna is a Cambium Networks PMP 450 antenna that features GPS synchronization, advanced scheduling algorithms, the cnMedusa™ technology that provides Multi-User MIMO (Multiple-Input, Multiple-Output) capability for nearly infinite beamforming patterns in the uplink and downlink and MU-MIMO in each direction as well. cnMedusa increases capacity per sector by allowing simultaneous data transfer to multiple subscriber modules (SM) within a sector for 5 GHz and 3 GHz bands and is certified for use in the new CBRS (U.S.) spectrum.[44]

Figure 9 Smith Beach in Northampton County Overhead View

The other residential antenna we observed was a Cambium Networks ePMP™ Force 200 5 GHz parabolic reflector antenna. This model adds a subscriber module and point-to-point (PTP) radio to provides superior throughput of over 200 Mbps of real user data. Long range deployment is enabled by the 25 dBi antenna. Configurable Modes of operation ensure robust adaptivity to both symmetrical and asymmetrical traffic while providing high performance and round-trip latency as low as 2 – 3 ms.[45]

Our overall impression after visiting Smith Beach was the community was well served with broadband connectivity.

8 Appendix C – Accomack/Northampton Regional Broadband Ext. Project (VATI) 2021[46]

An interesting ongoing request by the counties of Accomac and Northampton is the 2021 request for funding from the Commonwealth of Virginia to extend service to 8 communities, 1 in Accomac County and 7 in Northampton County. This is a partnership with cable company Charter Spectrum with an 80/20 split in funding with the grant to provide 80% and Charter Spectrum to provide 20%. Charter Spectrum is to manage the service on behalf of the counties.

Application ID: 75708122020132024

Program Name: Virginia Telecommunications Initiative 2021

Project Name: Accomack/Northampton Regional Broadband Ext. Project (VATI) 2021

Organization Name: County of Accomack, VA

Organization Address: 23296 Courthouse Ave. Accomac, VA 23301-0620

Project Contact Name: Amy Ford

Project Contact Phone: (757) 787-5714

Project Contact Email: aford@co.accomack.va.us

Profile Manager Name: Michael Mason

Profile Manager Phone: (757) 787-5716

Profile Manager Email: mmason@co.accomack.va.us

Total Requested Amount: $460,820.00

Table 3 Accomac/Northampton Budget Breakdown for Accomack/Northampton Regional Broadband Ext. Project (VATI) 2021

Cost/Activity Category	DHCD Request	Other Funding	Total
Telecommunications	$460,820.00	$115,205.00	$576,025.00
Construction	$460,820.00	$115,205.00	$115,205.00
Total:	$460,820.00	$115,205.00	$576,025.00

This is a regional project submittal that includes eight (8) different projects, 2 in Accomack County and 6 in Northampton County. Both Accomack and Northampton County have been designated Rural Counties through the2010 Census by the US Government Office of Management and Budget. In total, there are 19 incorporated towns on the Eastern Shore all of which have access to high-speed broadband. Outside of the incorporated towns, in the more rural portions of both Accomack and Northampton, is largely where the digital divide occurs. Broadband speeds are not widely available outside of the towns due to the remoteness of the locations. Wireless internet is problematic due to the topography of the Eastern Shore

[46] Accomack/Northampton Regional Broadband Ext. Project (VATI) 2021, website https://www.dhcd.virginia.gov/sites/default/files/Docx/vati/2021/applications/accomack-county-application-VATI2021.pdf, accessed 15 April 2021.

which is flat and heavily wooded. A recent survey of students conducted by the Accomack County Public School Division indicated that approximately 24% of students of had no access to the internet at all.

The 8 projects selected have all submitted requests to the counties for service in their areas. The counties certify there is no other terrestrial provider serving this area with broadband speed at or above 25/3.

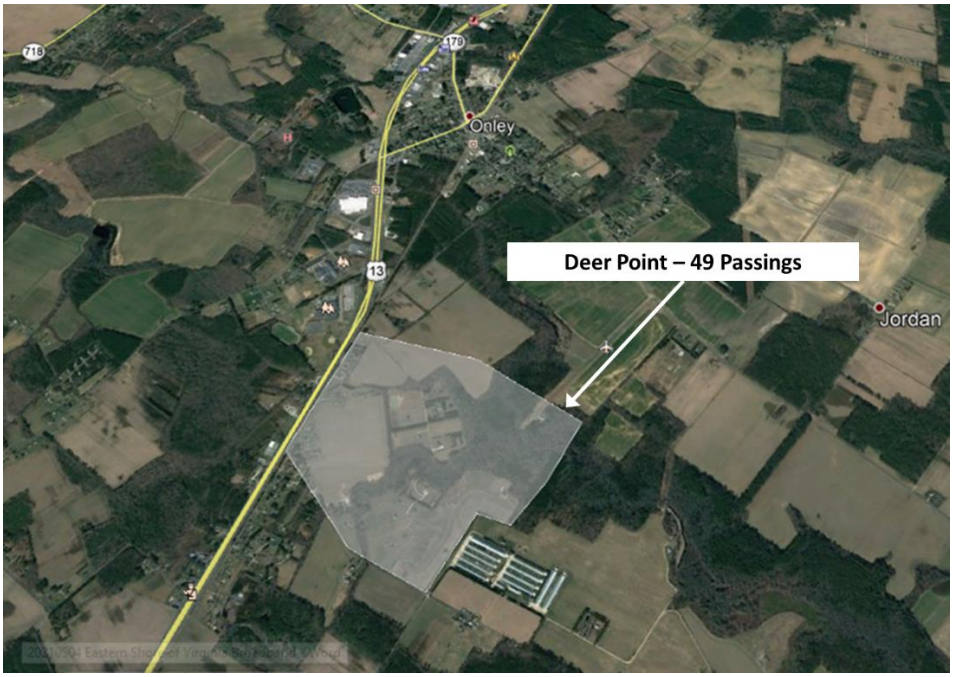

Figure 12 Deer Point: This is a rural area in Accomack County. This project would serve approximately 49 residential passings.

Figure 13 Red Bank Road: This is a rural area in Accomack County. This project would serve approximately 30 residential passings.

Figure 14 Lucille Lane (8 passings) and Kiptopeke Condominium Association (19 passings): These are two rural areas in Northampton County.

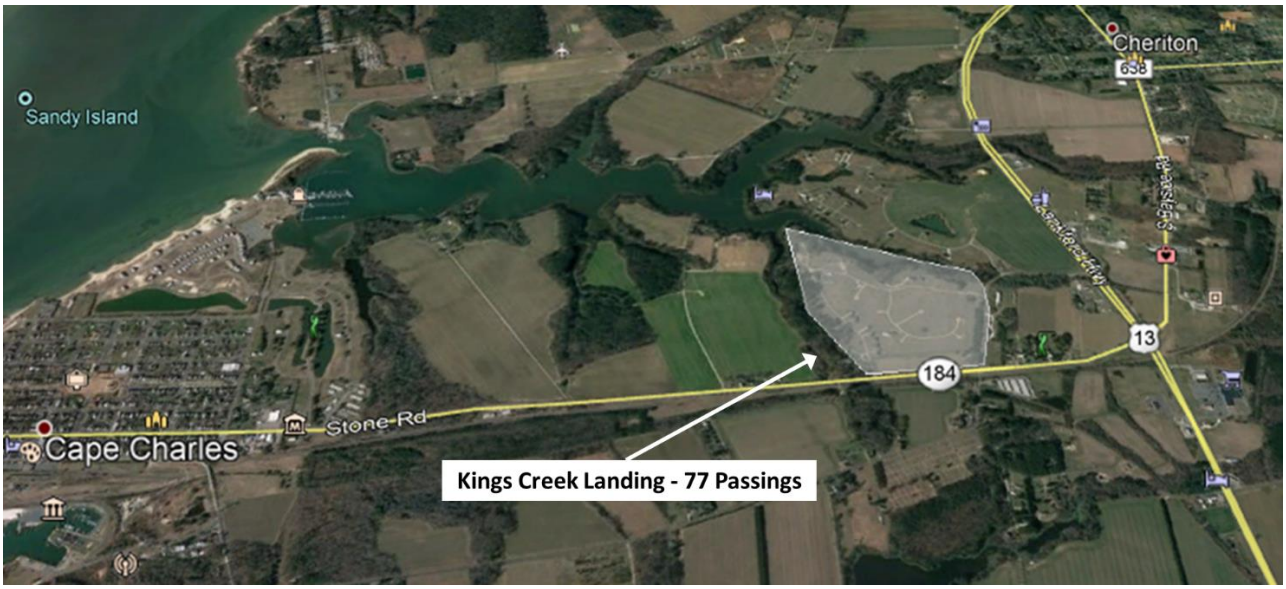

Figure 15 Kings Creek Landing (77 passings): This is a rural area Northampton County.

Figure 16 Nottingham Estates (55 passings), Arlington Chase (42 passings), and Bay Ridge (57 passings): These are 3 rural area in Northampton County.

9 Appendix D - Assawoman, Virginia 23302 Study Area

Assawoman is a rural area in Accomac County. There were 60 identified residential addresses. Based on our coverage analysis, Assawoman covers approximately 3 square miles. Charter Spectrum covers approximately 0.1 square mile essentially covering the housing area on Holly Acres Lane and Maple Drive where there are 20 homes, and additional 5 Homes on Atlantic Road which we assume is where their network feed is coming from. All of the other residences were covered by satellite or Neubeam DSL service. Coverage determined by address can be found in **Table 4 Assawoman, Virginia 23302 Addresses and Reported Coverage by Providers as of 15 April 2021**.

Figure 17 Assawoman, Virginia 23302 Coverage (60 Homes/3 square miles) by Neubeam DSL, HughesNet, ViaSat as of 15 April 2021

10 Appendix E - Mears, Virginia 23409 Study Area

Mears, Virginia was surveyed and there were 76 addresses listed by the county for the area. The team survey results for provider coverage are listed in **Table 5 Mears, Virginia 23409 Addresses and Reported Coverage by Providers.** Coverage was a bit substandard with the only offerings by Neubeam offering 5-30 Mbps Digital Subscriber Loop (DSL) service, Eastern Shore Communications Corporation 10 Mbps Fixed Wireless Access (FWA) and HughesNet Geo Satellite 25 Mbps service. Given the topography and close proximity to Rt 13 with Bethel Church Road at 2.17 miles it would seem to be an easy improvement to pull fiber to a central area in Mears for improved connectivity.

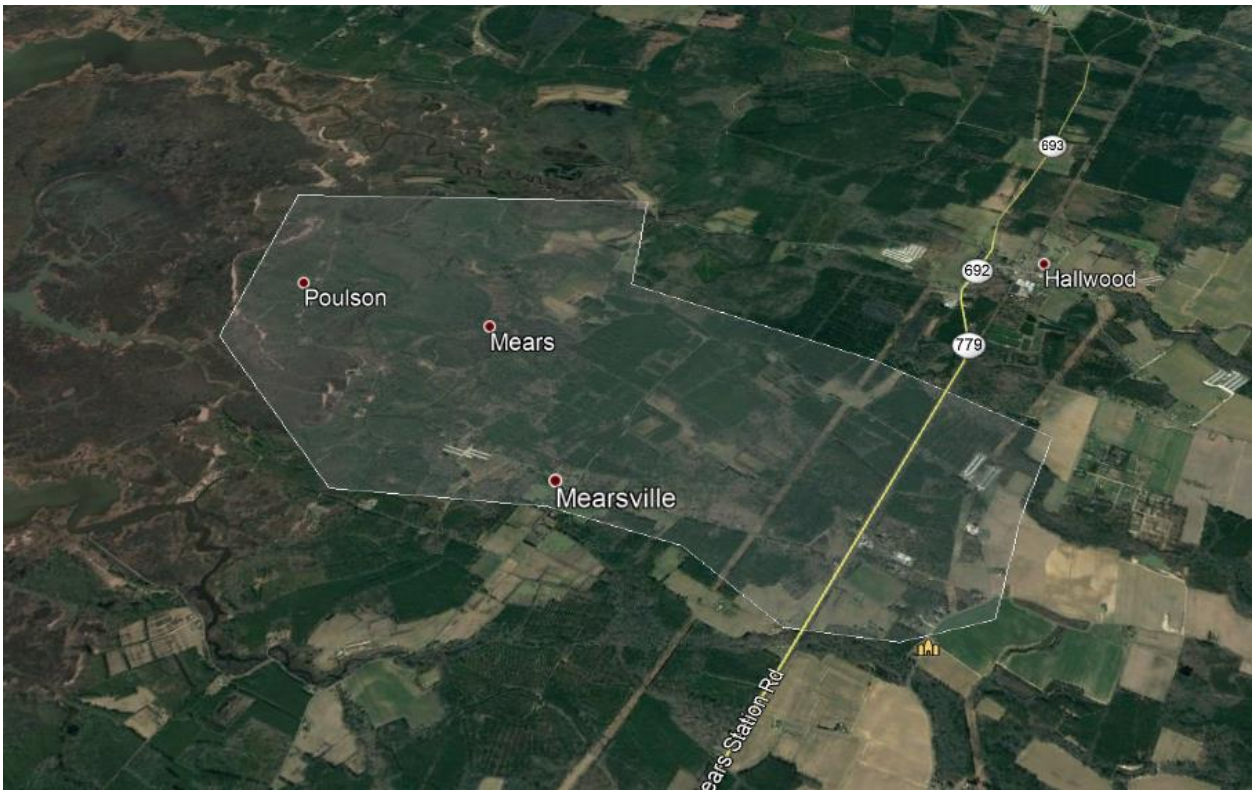

Figure 19 Mears, Virginia 23409 Neubeam Coverage Area (~4.5 square miles) as of 15 April 2021

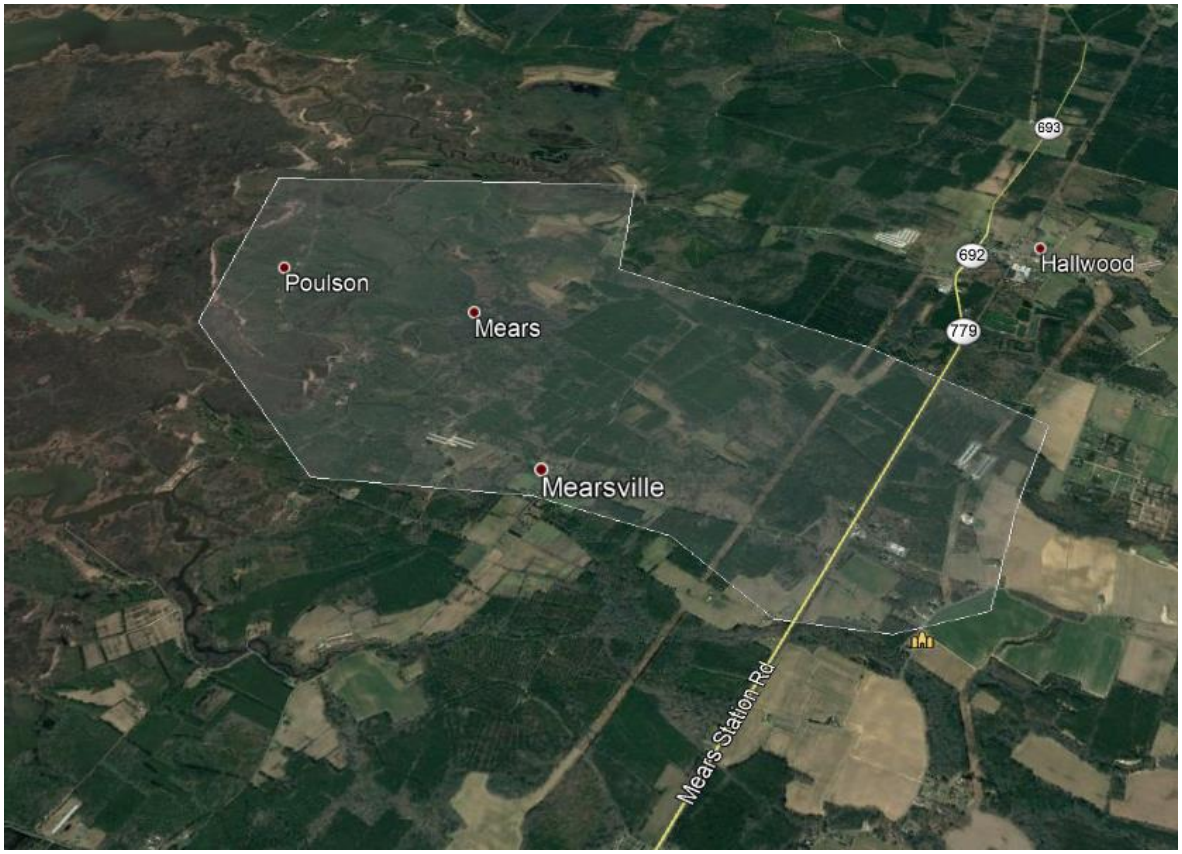

Figure 20 Mears, Virginia 23409 Eastern Shore Communications Reported Coverage Area (~4.5 square miles) as of 15 April 2021

11 Appendix F - Nassawadox, Virginia 23413 Study Area

12 Appendix G - Sanford, Virginia 23426 Study Area

Sanford, Virginia was chosen as a study area as the team felt it should have good coverage since spot checks revealed that ESVBA fiber had been pulled out to Saxis, Virginia and it was expected that many of the homes would have good coverage.

Figure 21 Sanford, Virginia 23426 Neubeam Coverage Area (~4.2 square miles, 175 homes)

13 Appendix H – Accomac and Northampton County Key Locations and Distance to Adjacent Populated Areas and Rt 13 Internet Cabling

For much of Accomac and Northampton Counties, many areas are less than 5 miles or less from Rt 13. Rt 13 is the major transportation artery that goes from Maryland down to the Bay Bridge tunnel. The ESVBA fiber is located adjacent to Rt 13. Some sample distances are shown in **Table 7 Selected Towns Adjacent to Rt 13 and Respective Distances from the Populated Chesapeake Bay and Atlantic Ocean Areas**

Table 7 Selected Towns Adjacent to Rt 13 and Respective Distances from the Populated Chesapeake Bay and Atlantic Ocean Areas

Town	Distance to Rt 13	Distance to Bay[47]	Distance to Atlantic[48]

14 Appendix I - Interview with Patrick Coady, Initial President ESVBA

Patrick Coady (Pcoady@coady.org) was the first President of the Eastern Shore of Virginia Broadband Authority. In our conversation he mentioned the issues involved in starting up the broadband authority and how proud he was that they were able to retire the startup debt provided by the counties and make the broadband authority a self-supporting organization.

Mr. Coady noted that Wallops Island was a major impetus for putting broadband on the eastern shore and that was a major source of the funding and ability for the broadband authority to be viable. Professor Williams expressed his appreciation for the broadband based on consulting work he performed with the National Oceanic and Atmospheric Administration (NOAA) National Environmental Satellite, Data, and Information Service (NESDIS) where the Wallops Island facility is the backup site for weather processing as well as a key satellite download and upload relay facility. Prior to the installation of the terrestrial broadband connectivity via the broadband authority, NESDIS was required to lease commercial satellite capacity to accept weather data downloads and then upload them for final processing at Suitland, Maryland. It is noted one of the key objectives of the study was to determine how to re-architect the NESDIS system to transition from 4km to 1km resolution weather data.

Mr. Coady also mentioned other examples of rural broadband initiatives that he thought were good examples of public/private cooperation. Location he mentioned were Ammon, Idaho; Vermont Cooperative Broadband[49]; Nevada Grants[50] and Rural Utilities Service (RUS) Funding[51]. Another study noted was the 2016 Old Dominion University study on broadband[52] that noted it was vital for economic development.

In imparting some of the history of the broadband authority, Mr. Coady mentions that Bay Creek Communications, originally the 3rd wireless carrier on the eastern shore, was bought by Charter Spectrum. He noted that the broadband authority held off on pushing fiber to the home (FTTH) for five years to encourage the wireless providers to expand their service and not compete against them. He noted several times that the broadband authority was a self-supporting non-profit entity whose goal was to provide service to the citizens. He also noted that the wireless carriers do receive discounts on their services.

One area Mr. Coady noted would be very helpful would be a wireless propagation study. The TCOM 750 class notes that all of the providers have a feature where you can input an address to determine service availability but there is not feedback other than a yes or no response.

15 Appendix J - Interview with Robert Bridgham, President ESVBA

Robert Bridgham is the current President of the Eastern Shore of Virginia Broadband Authority (ESVBA) and he was kind enough to join the TCOM 750 class during their weekly Zoom session. He was gracious enough to provide a background on the ESVBA as well as answer a number of questions the class had for him. He noted the ESVBA was formed in 2008 by a joint effort of the Accomac and Northampton Counties. He stated that the ESVBA had a pretty diverse mix of customers with the Virginia Beach Public Schools being one of their largest customers along with the National Aeronautics and Space Administration (NASA) Wallops Flight Facility (WFF). He noted that approximately 66% of the traffic that the broadband authority carries are for the bulk commercial customers such as Neubeam, ESCC and Charter Spectrum[53].

One very interesting discussion involved the broadband initiative program that the broadband authority developed to help small towns on the Eastern Shore pre done reports to get internet in

The ESVBA Wireless Internet Service Provider (WISP) program[5455] charges $3.50 mbit to encourage ISPs to provide service.

ESVBA has predictive program to help users find where service is available on their website.[56]

Mr. Bridgham also mentioned that FCC 477 forms can be found for census blocks (essentially zip code areas) covered. The TCOM 750 class did follow up on this and found

[53] It was noted that Bay Creek Communications became Chesapeake Bay Communications which was purchased by Charter Spectrum.

16 Appendix K - Interview with Ron Wolff, Accomac County Supervisor, Assawoman Resident

Ron Wolff was kind enough to communicate several times via phone and email and provided superb insider knowledge of the many problems experienced by residents. He provided invaluable insight to the many media articles we referenced in the Fall 2020 report where there was missing context.

17 Appendix L - FCC 477 Data for Accomac and Northampton Counties

In a search of the FCC 477 database on 02 April 2021, there were 30,201 entries. The results by provider are listed in the table below.

Table 8 Summary of FCC Filings for Accomac and Northampton Counties
